Supply Chain Consultancy

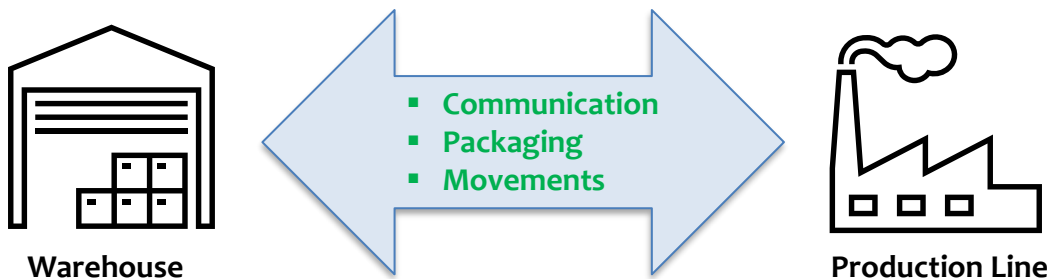

The Line-feeding job functions as an operational interface between Warehouse and Production to ensure the right goods come at the right time as per Production's requirements

In most cases the Line-feeding function has large Improvement potentials making it a hidden cost saving champion on space usage and shopfloor tidiness

The Issue:

By not having a streamlined communication and materials handling concept between Warehouse and Production the effects are **too much stock alongside production lines** occupying lots of space causing a higher risk of **Health & Safety issues**

A well-designed Line Feeding concept considers material ordering communication, suitable packaging, and the reduction of movements thereby reducing space requirements at production significantly. This results in **two big improvement** potentials: **additional machines** can be added on the shopfloor, and a **well-organized and clean** work environment

Supply Chain Consultancy Solution:

By introducing a refreshed Line-feeding concept companies can **increase turnover** without the need of additional space, **reduce Health & Safety issues** and have a **motivated workforce** thanks to a clean work environment

Supply Chain Consultancy Methodology:

First, an analysis will be done to find out current Line-feeding status, and which Line-feeding concepts are planned for the foreseeable future. **Second**, a tailor-made concept will be created with known methods and technologies to create a consensus in the organization. **Third**, a pilot study set-up is done to prove concept feasibility. **Fourth**, a company-wide execution will be facilitated
