Packaging is an underestimated element of Supply Chains with lots of saving potentials

In Industry the main functions of packaging are to protect the goods, reduce transport cost, ensure optimal storage, and reduce handling costs for bringing the goods to the production line

The Issue:

The best opportunity to take all these functions into account is at the engineering phase of both materials and packaging. In many cases, however, this does not happen resulting in **Inefficiencies** of transport cost, storage, and line-feeding

Optimizing packaging once being used by operations still can bring lots of benefits. A critical review of your actual packaging assortment can bring significant savings in operational costs

Supply Chain Consultancy Solution:

By making a thorough review of your current packaging **Inefficiencies & Waste** will be highlighted and potentials identified

Supply Chain Consultancy Methodology:

Review of packaging fill rates, calculation of opportunity cost – for example: buying foldable packaging versus keeping current non-foldable packaging -, reduction of production lineside stock levels, reduction of decanting activities, analysis of warehouse lay-out and packaging best fit
